

Some Aspects of Abelian Categories

Dhanjit Barman

Department of Mathematics Gauhati University, Guwahati, Assam

Abstract: Here we discuss how zero objects and zero morphisms behave in an abelian category. We also provide proofs of isomorphism between the kernels and between the cokernels of a morphism. We discuss some properties of abelian category.

Keywords: Zero object, Zero Morphism Kernel, Cokernel, Image, Coimage, Parallel Morphism, Abelian category, Preadditive category Additive Category, Preabelian Category.

1. INTRODUCTION

Here we discuss the behaviour of zero object and zero morphism in an abelian category. We also discuss how kernels of a morphism are isomorphic and that of cokernels of a morphism are also isomorphic. We have proved some properties of abelian categories. We have given proof of some properties of exact sequences. We also try to prove that in an abelian category every bimorphism is an isomorphism.

2. PRELIMINARIES

For notions of category theory we shall in general follow the notation and terminology of Popescu [6]. However, we do deviate somewhat.

For C a category and A, B objects of C , $\text{Mor}(A, B)$ denotes the set of morphisms from A to B .

We will also follow Popescu [6] for the definition of Preadditive, Additive and Preabelian and abelian category.

For kernel and cokernel we follow MacLane[2].

We follow the definition terminology of zero object and zero morphism from Popescu[6] and Pareigis[11].

We shall use the definition of Balanced category from Mitchel [3] Monomorphism from Schubert[5] and epimorphism and isomorphism from Pareigis[11].

3. MAIN RESULTS

1. PROPOSITION: There is a unique isomorphism between each pair of zero objects in a category.

Proof : Let us suppose that Z and X are two zero objects. Then $\text{Mor}(Z, X)$ contains exactly one morphism and $\text{Mor}(X, Z)$ consists only one morphism. Therefore the composition morphism $Z \rightarrow X \rightarrow Z$ is unique and it will be 1_Z , as $\text{Mor}(Z, Z)$ has only 1_Z .

Similarly the composition morphism $X \rightarrow Z \rightarrow X$ is also unique and it is 1_X .

Hence Z and X are isomorphic.

2. PROPOSITION: Let C be a category with zero objects. Then for objects $A, B \in \text{ob } C$, the map $0(A, B) : A \rightarrow B$ is independent of the choice of our zero object Z .

Proof : Let Z and X be zero objects in C. Then by definition of zero objects and by the definition of $0(A,B) : A \rightarrow B$ we have the following diagram.....

Now $g \circ f = 0(A,B)$, where f, g are unique. Since X is zero object so f' and g' are also unique. Thus k is unique as both Z and X are zero objects. We need to show that $0(A,B) = g' \circ f'$

By the uniqueness of g' and f' we have

$$g' \circ k = g \text{ and } k \circ f = f'$$

$$\text{now } g' \circ (k \circ f) = g \circ f$$

$$\Rightarrow (g' \circ k) \circ f = g' \circ f'$$

$$\Rightarrow g \circ f = g' \circ f'$$

$$\Rightarrow 0(A,B) = g' \circ f'$$

Thus $0(A,B)$ is independent of the choice of our zero object.

Note : This proposition shows that $0(A,B)$ is unique for objects A and B.

Also in a category with zero objects, the zero morphism exists for any pair of objects (A,B) by its definition.

From now onwards we will denote zero morphism by just 0.

3. Composition with zero morphisms yields zero morphism.

Proof : It is obvious from the definition of zero morphism.

4. Kernels are unique up to isomorphism.

Proof : Let C be a category with zero object 0. Let $f: A \rightarrow B$ is a morphism and $k: S \rightarrow A$ and $g: D \rightarrow A$ are two kernels of f .

As $g: D \rightarrow A$ is kernel of $f: A \rightarrow B$ and $f \circ k = 0$, therefore by definition of kernel there is a unique $p: S \rightarrow D$ such that $g \circ p = k$(i)

The following diagram shows—

Next, as $k: S \rightarrow A$ is a kernel of $f: A \rightarrow B$ and $f \circ g = 0$,

then there exists a unique morphism $h: D \rightarrow S$ such that

$$k \circ h = g \text{(ii)}$$

(i) $\Rightarrow (g \circ p) \circ h = k \circ h$
 $\Rightarrow g \circ (p \circ h) = g$ [from (ii)]
 $\Rightarrow p \circ h = 1_D$ [as kernel (g) is monomorphism](iii)
 (ii) $\Rightarrow (k \circ h) \circ p = g \circ p$
 $\Rightarrow k \circ (h \circ p) = k$ [from (i)]
 $\Rightarrow h \circ p = 1_S$ [since kernel (k) is monomorphism].....(iv)

From (iii) and (iv) we have that both the kernels are isomorphic.

5. Cokernels are unique up to isomorphism.

Proof : Let \mathcal{C} be a category with zero object 0. Let $f: A \rightarrow B$ be a morphism and $m: B \rightarrow C$ and $g: B \rightarrow D$ are cokernels of $f: A \rightarrow B$

As $g: B \rightarrow D$ is a cokernel of $f: A \rightarrow B$ and $m \circ f = 0$

Therefore by definition of cokernel we have a unique morphism $p: D \rightarrow C$ such that the following diagram.....

Also $m: B \rightarrow C$ is a cokernel of $f: A \rightarrow B$ and $g \circ f = 0$, therefore by definition we have a unique morphism $h: C \rightarrow D$ such that the following diagram

(ii) $\Rightarrow p \circ (h \circ m) = p \circ g$
 $\Rightarrow (p \circ h) \circ m = m$ [from (i)]
 $\Rightarrow p \circ h = 1_C$ (iii)
 (i) $\Rightarrow h \circ (p \circ g) = h \circ m$
 $\Rightarrow (h \circ p) \circ g = g$ [from (ii)]

$$\Rightarrow \text{hop} = 1_D \dots\dots\dots(\text{iv})$$

From (iii) and (iv) we have that the two cokernels are isomorphic.

Note that kernels and cokernels need not exist for all morphisms.

6. In an abelian category C ,the following are equivalent-

(i) $f: A \rightarrow B$ is monomorphism

(ii) 0 is kernel of f

Proof:- Let $f: A \rightarrow B$ be a monomorphism and $g: C \rightarrow A$ be its kernel.

$$\text{So } fog = 0.$$

$$\Rightarrow g = 0 \text{ (since } f \text{ is monomorphism)}$$

$$\Rightarrow 0 \text{ is kernel of } f$$

Conversely suppose that $0: 0 \rightarrow A$ is kernel of $f: A \rightarrow B$.

Let $g, h: C \rightarrow A$ be such that $fo(g-h) = 0$

$$\Rightarrow fo(g-h) = 0 \text{ (since } C \text{ is abelian category)}$$

$$\Rightarrow \text{there exists a unique morphism } k: C \rightarrow 0 \text{ such that } 0ok = g-h$$

$$\Rightarrow g-h = 0 \text{ .(since } 0ok \text{ is zero morphism)}$$

$$\Rightarrow g = h$$

$$\Rightarrow f \text{ is monomorphism.}$$

7. In an abelian category ,the following are equivalent-

(i) $f: A \rightarrow B$ is epimorphism

(ii) 0 is cokernel of f

Proof:- Let $f: A \rightarrow B$ be an epimorphism and $g: B \rightarrow C$ be its cokernel.

$$\text{So } gof = 0.$$

$$\Rightarrow g = 0 \text{ (since } f \text{ is epimorphism)}$$

$$\Rightarrow 0 \text{ is cokernel of } f$$

Conversely suppose that $0: B \rightarrow 0$ is cokernel of $f: A \rightarrow B$.

Let $g, h: B \rightarrow C$ be such that $gof = hof$

$$\Rightarrow (g-h)of = 0 \text{ (since } C \text{ is abelian category)}$$

$$\Rightarrow \text{there exists a unique morphism } k: 0 \rightarrow C \text{ such}$$

$$\text{that } ko0 = g-h$$

$$\Rightarrow g-h = 0 \text{ .(since } ko0 \text{ is zero morphism)}$$

$$\Rightarrow g = h$$

$$\Rightarrow f \text{ is epimorphism.}$$

8. In an abelian category, if $f: A \rightarrow B$ is monomorphism

then $\ker(\text{coker } f) = \text{im } f$ coincides with $f: A \rightarrow B$.

Proof:- Let us consider the diagram-

As f is monomorphism so $\text{ker}f = 0$ and cokernel of $0: 0 \rightarrow A$ is the identity morphism $1_A : A \rightarrow A$. Thus the above diagram becomes

Since C is abelian category we have f'' is isomorphism. So A is isomorphic to $\text{ker}(\text{coker}f)$.

For example, in the category \mathbf{Ab} of abelian groups, let $f: A \rightarrow B$ be a monomorphism. Then $f(A) \cong A$.

Also $p: B \rightarrow B/f(A)$ is cokernel of $f: A \rightarrow B$.

Consider the diagram

such that $po = 0$. Let us define $h: C \rightarrow A$ such that $h(c) = g(c)$ which is well defined.

Now $foh(c) = f(h(c))$

$$= h(c)$$

$$= g(c)$$

$\Rightarrow foh = g$. Also this is unique i.e. the diagram

Hence kernel of $p: B \rightarrow B/f(A) \cong A$ is $f: A \rightarrow B$.

9. In an abelian category, if $f:A \rightarrow B$ is epimorphism then $\text{coker}(\ker f)$ coincides with $f:A \rightarrow B$.

Proof : Let us consider the diagram-

$$\begin{array}{ccccc}
 \text{Ker}f & \xrightarrow{i} & A & \xrightarrow{p} & \text{coker}(\ker f) \\
 & & \downarrow f & & \downarrow f'' \\
 \text{Coker}f & \xleftarrow{j} & B & \xleftarrow{q} & \ker(\text{coker}f).
 \end{array}$$

As f is epimorphism so $\text{coker}f = 0$ and kernel of $0: B \rightarrow 0$ is the identity morphism $1_B: B \rightarrow B$. Thus the above diagram becomes

$$\begin{array}{ccccc}
 \ker f & \xrightarrow{i} & A & \xrightarrow{p} & \text{coker}(\ker f) \\
 & & \downarrow f & & \downarrow f'' \\
 0 & \xleftarrow{j} & B & \xleftarrow{q} & B
 \end{array}$$

Since \mathcal{C} is abelian category we have f'' is isomorphism. So B is isomorphic to $\text{coker}(\ker f)$.

10. A morphism $f: A \rightarrow B$ is an epimorphism iff $\text{im}f = B$.

Proof:- f is epimorphism iff $\text{coker}(\ker f) = B$

Since \mathcal{C} is abelian so $\text{coim}f \cong \text{im}f$ i.e. $\text{coker}(\ker f) \cong \ker(\text{coker}f)$

$\Rightarrow B \cong \ker(\text{coker}f)$

$\Rightarrow B \cong \text{im}f$.

11. Generally in any category \mathcal{C} every isomorphism is bimorphism but the converse may not be true. But in case of an abelian category every bimorphism is isomorphism.

Proof: Let \mathcal{C} be an abelian category and $f: A \rightarrow B$ be a bimorphism i.e. f is monomorphism as well as epimorphism. Let us consider the diagram

$$\begin{array}{ccccc}
 \text{Ker}f & \xrightarrow{i} & A & \xrightarrow{p} & \text{coker}(\ker f) = \text{coim}f \\
 & & \downarrow f & & \downarrow f'' \\
 \text{Coker}f & \xleftarrow{j} & B & \xleftarrow{q} & \ker(\text{coker}f) = \text{im}f.
 \end{array}$$

Now f is monomorphism $\Rightarrow 0$ is kernel of f

And cokernel of $0 \rightarrow A$ is the identity morphism $1_A: A \rightarrow A$.

Also f is epimorphism $\Rightarrow 0$ is cokernel of f

And kernel of $B \rightarrow 0$ is the identity morphism $1_B: B \rightarrow B$.

Thus the above diagram becomes

Which gives $f = 1_B \circ f'' \circ 1_A$

$$\Rightarrow f = f''$$

$\Rightarrow f$ is isomorphism as f'' is isomorphism.

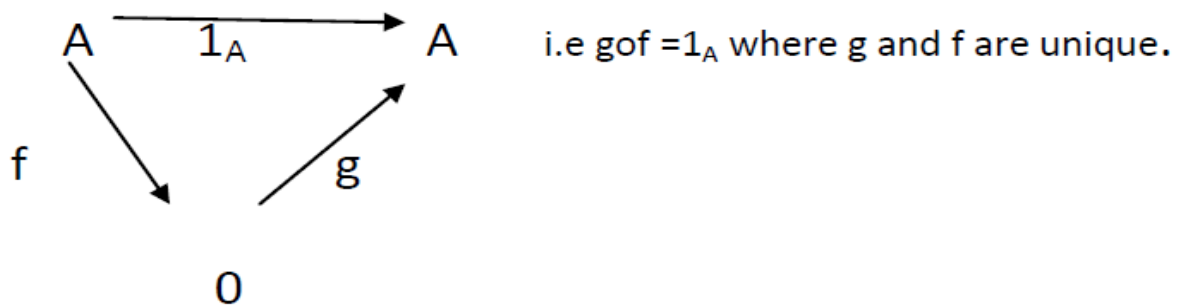

12. Let the category C has a zero object 0 .

(a) $A \in \text{ob}C$ is a zero object iff 1_A is zero morphism.

(b) if $m : A \rightarrow 0$ is a monomorphism, then A is a zero object.

Proof: (a) Let A be a zero object. Then 1_A is the only morphism from $A \rightarrow A$ as A is zero object. And hence 1_A is zero morphism.

Conversely suppose that 1_A is zero morphism. Then the following diagram commutes

Let $m, n : B \rightarrow A$. Then $1_A \circ g = g$ and $1_A \circ f = f$. As 0 is zero object we have a unique morphism $k : B \rightarrow 0$ such that from the diagram

We have $f \circ m = k = f \circ n$.

Now $g \circ f \circ m = g \circ f \circ n$

$$\Rightarrow 1_A \circ m = 1_A \circ n$$

$$\Rightarrow m = n.$$

Thus A is terminal object.

Similarly it can be shown that A is initial object .

Hence A is zero object.

(b) Let $m: A \rightarrow 0$ be monomorphism

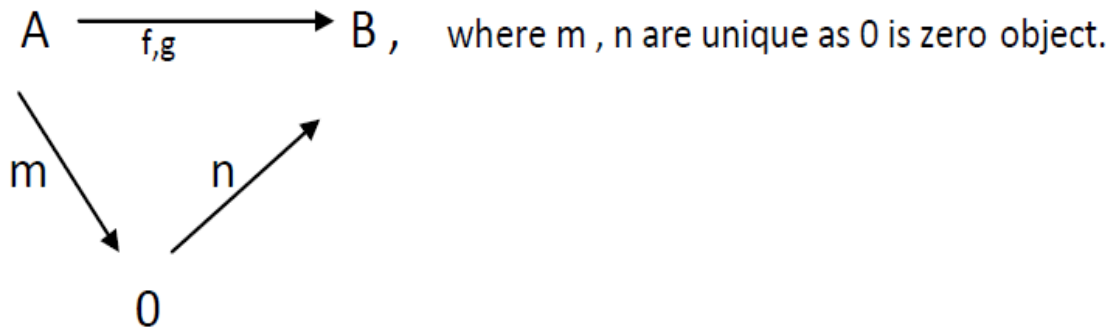

Let us consider $B \xrightarrow{f,g} A \xrightarrow{m} 0$ such that

$$m \circ f = m \circ g$$

$$\Rightarrow f = g \quad [\text{as } m \text{ is monomorphism}]$$

Thus A is terminal object.

Let $f, g : A \rightarrow B$ be two morphisms. Then we have the following diagram

Such that $n \circ m = f, n \circ m = g$

$$\Rightarrow f = g$$

Therefore A is initial object.

Hence A is zero object.

13. If $f : A \rightarrow B$ is monomorphism in an abelian category then it is kernel of some other morphism.

Proof: Let us consider the diagram

As f is monomorphism so $\text{ker } f = 0, \text{coker}(0) = A$ and $p = 1_A$. So the above diagram becomes

Also C is abelian so f'' is isomorphism, by definition.

Therefore $f \circ f'' = q$. Which shows that $f : A \rightarrow B$ is kernel of $j : B \rightarrow \text{coker } f$.

14. Any epimorphism in an abelian category is the cokernel of a morphism.

Proof : Let us consider the diagram

$$\begin{array}{ccccc}
 \text{Kerf} & \xrightarrow{i} & A & \xrightarrow{p} & \text{coker}(\text{kerf}) = \text{coim}f \\
 & & \downarrow f & & \downarrow f'' \\
 \text{Cokerf} & \xleftarrow{i} & B & \xleftarrow{q} & \text{ker}(\text{cokerf}) = \text{im}f
 \end{array}$$

As f is epimorphism so cokerf is 0. Therefore $\text{ker}(0) = B$

And $q = 1_B$. Now the above diagram becomes

$$\begin{array}{ccccc}
 \text{Kerf} & \xrightarrow{i} & A & \xrightarrow{p} & \text{coker}(\text{kerf}) = \text{coim}f \\
 & & \downarrow f & & \downarrow f'' \\
 0 & \xleftarrow{j} & B & \xleftarrow{1_B} & B
 \end{array}$$

As C is abelian category so f'' is isomorphism, by definition. Thus $f'' \circ f = p$. Which shows that $f: A \rightarrow B$ is cokernel of $i: \text{kerf} \rightarrow A$.
